                                                       Immunogenic composition for generating antibodies against respiratory syncytial virus - comprises non-replicating vector containing the protein G sequence, useful in protective vaccines and to raise antibodies for diagnosis
                                                                                                                                                  vaccines by inserting the G protein gene into a non-replicating vector. The G protein is placed under the control of alternative signal and expression sequences, for example the chimeric G protein produced may also comprise the signal peptide of tissue plasminogen activator (tPA). The recombinant vector may also comprise sequences upstream of the G protein gene which enhance the G proteins immunoprotective ability. The resulting immunogenic composition will agenerate antibodies directed against the RSV G protein when administered to a host organism. The composition is useful as a vaccine to immunise against RSV-associated disease, particularly resulting in a balanced Thi/Thz immune response and for raising Ab, usual immunisation and cell fusion methods.
                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                        consists of two gene sequences which are linked and encode antigenic regions, these two sequences being derived from two different pathogens (parainfluenza virus (PIV) and respiratory syncitial virus (RSV)). The gene sequences that are particularly used are those which encode PIV-3 F and HN proteins (AAQ45683, AAQ45684) and RSV F a (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            900
                                                                                                                                                                                                                                                                                        The respiratory syncytial virus (RSV) G protein can be used in vaccines by inserting the G protein gene into a non-replicating vector. The G protein is placed under the control of alternative signal and expression sequences, for example the chimeric G protein produced may also comprise the signal peptide of tissue plasminogen activator (tPA). The recombinant vector may also comprise sequences upstream of the G protein gene which enhance the G proteins immunoprotective ability. The resulting immunogenic composition will administered to a host organism. The composition is useful as a vaccine to immunise against RSV-associated disease, particularly resulting in a balanced Th1/Th2 immune response and for raising Ab, by usual immunisation and cell fusion methods.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                        A novel plasmid which comprises a DNA sequence encoding this protein, and the protein itself, are claimed, for use as HRSV sectimes. The vactime can be administered to pregnant women or to women of child bearing age to stimulate maternal antibodies. Infants can also be vaccinated at 2-3 months of age. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Vaccines for human respiratory virus - comprising proteins or fragment encoded by a DNA sequence coding for human respiratory syncytial virus proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The proteins are P, G, 22K, 9.5K and major capsid protein N. The sequences and encoded proteins are useful for preparing vaccines against HRSV. The vaccines can be used to confer

The specification describes a composition comprising a polynucleotide consisting of an antisense oligonucleotide containing a hydroxy group, complementary to the genomic or antisenonic strand of a negative-strand RNA virus; and an activator of RNAse L. The polynucleotide is used to inhibit, or treat, infection by negative-strand RNA viruses, specifically respiratory syncytial virus (RSV) but also (para)influenza, mumps, and rables. The polynucleotide can cross cell membranes without requiring carriers or permeabilizing agents, and can selectively cleave the RNA targeted by the oligonucleotide. The present sequence represents the polynucleotide sequence of RSV strain A2.
                                                                                                                                                                                                                                                                                     10331 CACAAAGTCACACCAACAACTGCAATCATACAAGAATGCAACAAGACCAGATCAAGAACACA

A human respiratory syncytial virus (RSV) anti-genome sequence (AATG1430) is the 5' to 3' positive-sense sequence of RSV; the genominated is segative-sense. It was synthesised in segments by RT-PCR using intracellular RSV mRNA or genomic rRNA isolated from purified viruses as template. Restriction site markers were introduced by incorporating the changes into the primers used for RT-PCR. The recombinant sequence can be expressed with a nucleocapsid protein, a large polymerase protein and an RNA elongation factor to produce isolated infectious RSV particles useful for generating vaccines against RSV. Recombinant RSV genome or antigenome can also be used as a vector for gene therapy of the AAT63430 standard; DNA; 15223 96WO-US15524. 95US-0007083. The polynucleotide can be used to treat RSV infections, which can also be treated by administration of the antisense oligonucleotide, so as to form a complex with activated RNase L in vivo. The polynucleotide can be transported across the cell membranes without carriers or permeability agents, and once introduced destroys antisense target RNA. It also inhibits RSV infection in vitro in a superior manner to the conventional drug, ribavirin. ```
This is the 5'-3' positive sequence nucleotide sequence of respiratory syncytial virus (RSV) D46. The genome is negative-sense; the complete nucleotide sequence of the negative-sense; the complete nucleotide sequence of the wild-type B-1 virus has also been determined (see AAV1755).

A novel infectious recombinant RSV comprises a RSV genome or antigenome, a major nucleocapsid (N) protein, a nucleocapsid (N) protein, a nucleocapsid (N) antigenome or nucleocapsid (N) protein, a nucleocapsid (N) antigenome or nucleocapsid (N) antigenome or sequence ensitive (Es) substitution at amino acid Phe521, antigenome in the RSV polymerase gene or a ts; nucleotide substitution in the gene-start sequence of gene M2.

Also claimed are: (1) an isolated infectious RSV particle which comprises a recombinant RSV (anti)genome, N, P, and L proteins, a RNA polymerase elongation factor, where the (anti)genome is modified: (1) to ablate or modulate expression of a SH, NS1, NS2 or G gene or a cis-acting regulatory sequence; and (ii) by a termination codon introduced within a selected gene, or by a change in sequence, position or presence of a GS or GE transcription signal relative to the selected gene, (2) an expression vector; and (3) an RSV strain selected from cpts RSV 248 (ATCC WR 2453), cpts RSV 530 (ATCC WR 2452), or cpts 530/1030 (ATCC WR 2451), cpts 248/4955 (ATCC WR 2453), cpts RSV 530 (ATCC WR 2452) or cpts 530/1030 (ATCC WR 2452) or cpts 105/2026 (ATCC WR 2451) or cpts 830/1030 (ATCC WR 2452) or cpts moderned recombinant RSV and RSV particles are used in a vaccine to returned recombinant RSV and RSV particles are used in a vaccine to returned and a system of a mindividual to induce or expense or expense or expense or expense or expense or expense or expense or expense or expense or expense or expense or expense or expense or expense or expense or expense or expense or expense or expense or expense or expense or expense or expense or expense or expense or expense or expense or expense or expense or expense or expense or expens
                                                                                                                                                                                                                                          Attenuated respiratory syncytial virus vaccines - useful to protect
individuals against RSV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 15223 BP; 5921 A; 2704 C; 2361 G; 4236 T; 1 other;

This antigenome cDNA, termed D46, was synthesized in segments by RT-PCR using synthetic oligonucleotides as purimers and intracellular RSV mRNA or genome RNA isolated from as purimers and intracellular RSV mRNA or genome RNA isolated from conviral G triplet contributed by the T7 promoter, 4 sequence markers (see AAA88745-47) at positions 1059 (which adds 1 nucleotide contributed to the 3' end by ribozyme cleavage. The invention contributed to the 3' end by ribozyme cleavage. The invention contributed to the 3' end by ribozyme cleavage. The invention cucleocapsid (N) protein, a nucleocapsid (N) protein, a nucleocapsid phosphoprotein (P), a charge polymerase protein (1), an RNA polymerase elongation factor, and a partial or complete RSV genome or antigenome of one RSV errain or subgroup virus. The chimeric RSV is cifferent RSV strain or subgroup virus. The chimeric RSV is ciffered at the unsubsection of selected mutations. It is useful as a vaccine against RSV, which causes classes such as pneumonia and bronchiolitis in infants. The chimeric representation or subgroup virus in an antitype and a partial results RSV infection and attenuated, preferably by introduction of selected immune system of an individual is stimulated to induce protection and individual is stimulated to induce protection of against RNA in a result we made and protection and protection and protection and protection and protection of selected immune system of an individual is stimulated to induce protection and antitype made and protection with a protection and protection and protection and protection and protection and protection and protection and protection and protection and protection and protection and protection and protection and protection and protection and protection and protection and protection and protection and protection and protection and protection and protection and protection and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CACAAAGTCACACTAACAACTGCAATCATACAAGATGCAACAAGCCAGATCAAGAACACA

                                                                                                                                                                                                      The present invention relates to a chimeric nucleic acid construct comprising: a nucleotide sequence adapted for protein expression in plants, and a respiratory syncytial virus (RSV) coding sequence encoding an RSV protein or an antigenic protein or peptide of RSV. The construct can be used to immunize animals and humans against respiratory syncytial virus. The use of transgenic plants to generate the antigen allows the production of greater amounts of

                                                                                                                                                                                                                                                                                            ð
                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a recombinant Sendar virus comprising an antigenic fragment. The virus may be administered in combination with an antifytral chemotherapeutic compound. Two or more viruses expressing different PMV proteins nay be co-administered. Compositions comprising the virus are useful for eliciting a humoral and/or cellular immune response to a PMV in a mammal, particularly a human. Further a recombinant Sendai virus comprising an exogenous moleic acid encoding a second PMV protein is also administered and priming and/or controling a second PMV protein is also administered and priming and/or posting humoral or cellular immune response comprises administering one or more of a recombinant or isolated PMV protein or its antigenic fragment, a DNA vaccine encoding the same, and a non-Sendai viral vector encoding a PMV protein. The recombinant virus is useful as an effective vaccine against hPIV or RSV (the major causes of paediatric respiratory disease) and also to express any gene of interest in target cells, providing a positive medical impact on impaired cells #Mild-type globin gene transfer (i.e. gene therapy) into stem cells effects a cure for sickle cell disease or betathassaemia. The recombinant virus may also prove effective in conferring immunity to human immunodeficiency virus (HIV) infection. The Sendai virus replicates at level that is high enough to induce sufficient immunity, but does not cause any harm to human virus (RSV) g protein (heavily glycosylated protein), a PMV protein virus suitable for expression by the recombinant virus of the invention.

It has been inserted into plasmid pcDNA3 (see AAV38297) to create plasmid pCT4. This plasmid contains a human cytomegalovirus immediate early promoter and the RSVG gene portion such that when an in-frame fusion is made, the resultant fusion protein may be transported to, and anchored in, a mammalian cell

membrane where it can be exposed to the host immune system.

C Insertion of pneumococcal surface protein A (PBpA) coding sequence created plasmid pKSD2601. Intramuscular immunisation of BALBA/C mice with pKSD2601 induced protection against an otherwise lethal cohallenge with a capsular type 3 pneumococcus. A claimed plasmid for expression of pneumococcal epitope DNA in enkaryotic cells includes a promoter for driving expression in a eukaryotic cells includes a promoter for driving expression in a eukaryotic cells (e.g. HCMV-IE), DNA encoding a leader sequence (e.g. of RSVG) cand DNA encoding a pneumonoccal epitope such as PspA. The invention also provides a vaccine comprising the plasmid and a suitable carrier or diluent, and optionally one or more cytokines or DNA encoding them, or a bacterial delivery system. The vaccine is used to elicit an immunological response in a host, including humans, susceptible to pneumococcal infection or sepsis. The plasmid can also be used to express a pneumococcal epitope of interest in vitro.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 696 BP; 284 A; 211 C; 78 G; 123 T; 0 other;

The genome is negative-sense to respiratory syncytial virus (RSV). The genome is negative-sense to be 5.-3' positive-sense sequence of D46 is provided in AAV17553.

A novel infectious recombinant RSV comprises a RSV genome or antigenome, a major nucleocapsid (N) protein, a nucleocapsid phosphoprotein (P), a large polymerase protein (L), and a RNA polymerase elongation factor, where the recombinant RSV has at least two attenuating mutations, one of the mutations specifying a temperature-sensitive (ES) substitution at amino acid Rhe521, and claimed are: (1) an isolated infectious RSV particle which comprises a recombinant RSV (anti)genome, N, P, and L proteins.

Comprises a recombinant RSV (anti)genome, N, P, and L proteins, RNA polymerase elongation factor, where the (anti)genome is modified: (1) to ablate or modulate expression of a SH, NS1, NS2 or G gene or introduced within a selected gene, or by a change in sequence, position or presence of a GS or GB transcription signal relative to the selected gene, (2) an expression vector; and (3) an RSV strain selected from cpts RSV 248 (ATCC WR 2450), opts 248/404 (ATCC WR 2452), cpts 830/1009 (ATCC WR 2451), cpts 844/40 (ATCC WR 2452), cpts 830/1009 (ATCC WR 2451) or cpts 530/1009 (ATCC WR 2451) or cpts 530/1009 (ATCC WR 2452) or entimalate prenamentary and RSV particles are used in a vaccine attenuated recombinant RSV and RSV particles are used in a vaccine of entimalate prenamentary.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    181 CHACCCACACCACAGACTAAAAACACAACAACAACCAAACACACAACCAAGCCC 240

Respiratory syncytical virus is a negative-strand RNA pleomorphic enveloped virus of the genus Pneumovirus. The matrix protein has no homology with the matrix proteins of other negative-stranded RNA viruses, implying that RS virus has undergone extensive evolutionary divergence. Two unidentified reading frames which potentially encode proteins were located: one overlaps the matrix protein and the other the P protein. The biological significance of these two reading frames is not clear. The positive strand is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /translation="WGSNSISMIKVRLQNLFDNDBVALLKITCYTDKLIHLTNALAKA
